

Integrity Constraints

If a center is in a certain area, that area will be monitored by that center.

Since an operator can change centers but can only be present in one of them at a time, parameters added by an operator who is now no longer in the center in which they were present when they submitted that parameter, will not have to be deleted, but will still be considered valid.

When submitting a parameter, the operator sending the parameter must be employed within the center that is being monitored. If he's not, the parameter will not be submitted.
