The Email class creates and sends an email through the use of a SMTP server

The identifiers the database can use to assign an error message to the parameter that violated an integrity constraint or server check

Email

-m_senderEmail: String = ""
-m_senderName: String = ""
-m_receiverEmail: String = ""
-m_subject: String = ""
-m_message: String = ""

+Email(sender_email: String, sender_name: String)
+setReceiver(receiver: String)
+setSubject(subject: String)
+setMessage(msg: String)
+send(): boolean
